

Release 6.2 — B2B Level-1 Product Brief

Audience: Business investors and strategic partners

Document type: Feature vision and requirements (non-technical)

Product: PaySaSuchan — Business (Small & Medium Enterprises)

Release theme: B2B onboarding and day-one expense operations for Indian SMBs

Executive summary

Release 6.2 introduces PaySaSuchan's **business (B2B) experience** as a focused **Level-1** offering. The goal is not to replicate every enterprise ERP feature on day one. Instead, we give **small and medium businesses** a credible starting point: register the business, verify identity at a basic level, log expenses with **GST-aware fields**, review spending on a **business dashboard**, and get help from an **AI assistant** tuned for business money questions.

This release builds on the trust and product maturity already established in our **consumer (B2C)** product—personal expense tracking, groups, reminders, and AI-assisted insights—while adding the **business identity, compliance hooks, and workflows** that SMB owners and finance leads expect when they adopt a dedicated expenses platform.

Level-1 means: *onboard → log → see → ask → manage profile*. Deeper capabilities—multi-user approvals, payroll, full accounting integrations, advanced forecasting models—are intentionally positioned as **follow-on releases** once adoption and feedback validate the core loop.

Why now: the SMB opportunity

Indian SMBs face a recurring set of pressures:

- **Cash and spend visibility** scattered across UPI, cards, petty cash, and vendor invoices
- **GST and invoice discipline** required for compliance and clean books, but often handled in spreadsheets
- **Limited finance headcount**—owners or one “finance person” wear many hats
- **Growing expectation of AI** for quick answers (“Where did we overspend?”) without hiring analysts

PaySaSuchan's B2B Level-1 targets owners and operators who need **practical expense management first**, with a path toward **smarter insights and forecasting** as the product matures.

Target users (initial focus)

Segment	Primary need in 6.2
Micro & small businesses (1–20 employees)	Simple business expense log, GST on entries, clear monthly view
Growing SMBs (finance-light teams)	Dashboard filters, export-ready discipline, AI Q&A on spend
Founders / proprietors	Fast onboarding, minimal KYC friction, mobile-friendly logging

Primary persona: Business owner or office manager who currently uses personal apps, WhatsApp receipts, or Excel—and wants one **business-branded** place to record and review expenses.

Release 6.2 scope — five capability areas

The following sections describe **what** we intend to deliver and **why it matters** for customers and investors. Wording is requirements-oriented; implementation choices are intentionally omitted from this document.

1. Business onboarding

Onboarding is the front door for B2B trust and conversion. Level-1 onboarding should feel **purpose-built for business**, not a consumer signup with a different logo.

1.1 Discovery and positioning (marketing surfaces)

- **Business menu entry** on public landing and navigation so prospects can self-select “For Business” vs personal use.
- **Business branding page** that explains value for SMBs: expense control, GST-ready logging, dashboard visibility, and AI support—without overwhelming feature lists.
- Clear **call to action**: start business registration or sign in to an existing business account.

Requirements

- Distinct B2B positioning copy and visuals (trust, compliance-friendly tone, SMB examples).
- Consistent brand story across web entry points; mobile business entry aligned where the product roadmap includes business apps.

- Analytics-friendly CTAs (investor-relevant: measure interest before full product depth).

1.2 Authentication and verification

- **Business account creation** separate from—or clearly elevated above—personal-only signup, so a user understands they are creating or joining a **business workspace**.
- **Email and/or mobile verification** consistent with consumer-grade security expectations.
- **Session and account recovery** flows suitable for business users who may share devices or delegate logging later (Level-1: single primary admin; delegation is future scope unless explicitly added).

Requirements

- Verified contact channel before sensitive business data is stored.
- Clear messaging when an account is personal vs business-linked.
- Fraud-resistant signup patterns appropriate for a financial product (rate limits, verification, support path).

1.3 Basic KYC (Know Your Customer)

Level-1 KYC is **proportionate**: enough to establish business legitimacy and support future compliance, without enterprise-grade document workflows in the first release.

Intended data themes (to be finalized with legal/compliance)

- Legal business name and trade name (if different)
- Business type (proprietorship, partnership, private limited, etc.)
- Registered or operating address
- Tax identifiers relevant to India (e.g. **GSTIN**, **PAN** where applicable)—captured with validation rules
- Authorized representative name and contact

Requirements

- Guided step-by-step KYC with save-and-resume.
- Status visibility: *draft*, *submitted*, *verified*, *needs attention*.
- User-facing explanation of **why** each field is collected (trust and completion rates).
- Admin or operations review path for edge cases (manual verification queue—operational detail, not customer-facing complexity).

Out of scope for strict Level-1 (candidate for 6.3+)

- Full video KYC, bank account verification mandates, or regulatory filings automation.

2. Business expense logging

Expense logging reuses the **familiar PaySaSuchan mental model** from B2C—fast capture, categories, amounts, dates, notes—while adding **business and GST context** on every relevant entry.

User stories (representative)

- “I paid a vendor for office supplies; I need amount, category, date, and **GST breakdown** in one place.”
- “I want the same speed as personal logging, but the record is clearly **business**.”
- “I need to attach or reference an invoice number for later audit.”

Requirements

- Create, edit, and delete business expenses (within plan and permission rules).
- **GST fields** on expense creation (exact field set to be finalized), for example:
 - Taxable value, GST rate or amount, CGST/SGST/IGST split where applicable
 - Vendor GSTIN (optional or required by expense type—policy TBD)
 - Invoice or bill reference number
- **Business vs personal** must never be ambiguous in the UI and reporting.
- Categories suited to SMB operations (travel, utilities, rent, marketing, professional fees, etc.)—starter taxonomy with room to customize later.
- Support for common payment modes (cash, UPI, card, bank transfer) as labels, not full bank sync in Level-1 unless explicitly added.
- Optional receipt attachment (photo/PDF) where product infrastructure already supports uploads.

Success criteria

- A new business user can log a GST-aware expense in under one minute after onboarding.
- Exported or dashboard views can explain **total spend** and **tax-related totals** at a summary level.

3. Dashboard and filters

The business dashboard answers: “**What did we spend, when, and on what?**” without requiring spreadsheet skills.

Requirements

- **Summary tiles** for a selected period: total expenses, count of transactions, top categories (and optionally top vendors).
- **Time filters**: today, this week, this month, custom range, financial year awareness (India FY: April–March) as a product default where relevant.
- **Category and GST filters** to isolate ITC-relevant spends, travel, or a single vendor.

- **Search** by note, vendor name, or invoice reference.
- **List + detail** pattern: dashboard aggregates drill down to individual expenses.
- Empty and low-data states with guidance ("Log your first business expense").

Future-friendly design (not mandatory for first ship)

- Comparison to prior period ("vs last month").
- Simple **forecast teaser** or trend line based on historical averages—full **business forecasting** module is a natural **post-6.2** upsell aligned with your roadmap ideas.

4. AI chatbot (business context)

The AI chatbot provides **conversational access** to business expense knowledge—grounded in the user's **own business data** where possible, with safe boundaries when data is missing.

Example questions users should be able to ask

- "How much did we spend on marketing this month?"
- "What were our top three expense categories last quarter?"
- "Explain GST on our recent office rent entry."
- "What should I log for a software subscription with 18% GST?"

Requirements

- Business-scoped conversations (no leakage of personal-only data when accounts are linked).
- Plain-language answers; when the system cannot answer from data, it says so and suggests a concrete next step (e.g. add a category, widen date range).
- Guardrails: no legal or tax filing advice presented as professional counsel; educational tone with disclaimers where appropriate.
- Rate and plan limits aligned with existing freemium/starter/pro philosophy for B2B tiers (commercial packaging TBD).

Relationship to "business forecasting"

- **6.2:** AI explains **what happened** and simple **forward-looking hints** (e.g. "At this pace you may exceed last month's travel budget").
- **Later releases:** dedicated forecasting views, scenarios, and cash-flow projections for SMB boards and lenders.

5. Profile and settings (business)

Business users need a single place to manage **identity, compliance data, and preferences**.

Requirements

- View and edit **business profile** (name, address, tax IDs) with re-verification rules when critical fields change.
 - **KYC status** and resubmission if rejected or incomplete.
 - **Notification preferences** for business events (KYC updates, plan limits, optional weekly spend digest).
 - **Security**: password change, session awareness; future multi-user admin invites listed as roadmap.
 - **Billing and plan** surfacing for B2B SKUs when commercial packaging is live (can mirror consumer patterns: trial, upgrade, invoices).
 - **Data and support**: link to help, contact support, and clear privacy/data use summary for business accounts.
-

What Release 6.2 is not (boundary statement)

To protect delivery focus and investor expectations, the following are **not** committed in Level-1 unless explicitly added to the release charter:

- Full **multi-user roles** (approver, accountant, employee submitter) and approval chains
- Payroll, inventory, or general ledger replacement
- Deep integrations with Tally, Zoho Books, or banks (may be piloted later)
- Advanced **ML forecasting**, lender-grade models, or automated tax filing
- Enterprise SSO, custom contracts, and dedicated tenancy

These items form a credible **6.3+ roadmap** and strengthen the long-term B2B story without over-promising in the first business release.

Value proposition for investors

Stakeholder benefit	How 6.2 supports it
Market expansion	Opens SMB segment adjacent to proven B2C engagement
Monetization	Business plans, higher ARPU, GST/compliance as upgrade drivers
Defensibility	India-first GST expense graph + AI on proprietary business spend data
Upsell path	Onboarding + logging → dashboard → AI → forecasting → integrations
Operational proof	KYC and business identity enable partnerships (banks, accountants, marketplaces)

Suggested success metrics (Level-1)

Metrics should be agreed before launch; indicative categories:

- **Acquisition:** Business landing page visits → started onboarding → completed KYC
- **Activation:** % of verified businesses with ≥5 expenses in first 14 days
- **Engagement:** Weekly active business loggers; dashboard views per account
- **AI:** Questions per active business; satisfaction or thumbs feedback
- **Retention:** Month-2 return rate for businesses that completed KYC
- **Commercial (when live):** Trial-to-paid conversion for business tiers

Phasing inside 6.2 (recommended)

For internal planning and investor transparency, work can be sequenced without changing the **external** Level-1 promise:

Phase	Focus	Customer-visible outcome
A	Landing, business menu, auth, KYC shell	"We can sign up as a business"
B	GST expense logging	"We can run daily books in the app"
C	Dashboard and filters	"We can review spend by period and category"
D	Business AI chatbot	"We can ask questions in plain language"
E	Profile, settings, polish	"We can manage the business account confidently"

Phases may overlap in development; the table communicates **risk reduction** and demo milestones for investors.

Open decisions (to finalize in product workshops)

This document is a living brief. Decisions marked below will be updated as you lock ideas:

1. **Single business per user vs multiple businesses** under one login (Level-1 recommendation: one business per owner account, expand later).
2. **Mandatory vs optional GST fields** by expense type and business registration status.
3. **B2B pricing** (standalone SKU vs bundle with consumer Pro).
4. **Mobile parity** for 6.2 launch (web-first vs simultaneous mobile business mode).
5. **KYC depth** vs speed-to-activate tradeoff and partner requirements.
6. **AI scope** for launch: read-only insights vs allowing chat-initiated expense drafts.
7. **Forecasting**: confirm as **6.3+** flagship or a limited 6.2 teaser only.

Roadmap preview (beyond 6.2)

Aligned with your longer-term B2B vision for SMB expense management:

- **Team & approvals** — employees submit, managers approve, finance exports
- **Integrations** — accounting exports, bank feeds, GST return prep helpers
- **Business forecasting** — cash runway, category budgets, scenario planning
- **Partner channel** — CAs, MSME lenders, and marketplaces embedding PaySaSuchan business insights

Release 6.2 is the **foundation layer** that makes these extensions credible because the **business identity and expense graph** exist in one system.

Document control

Field	Value
Version	0.1 (draft for investor review)
Release	6.2 — B2B Level-1
Status	Feature discussion; subject to your finalized idea list
Next update	After internal feature lock and compliance review

This brief is intentionally non-technical. A separate engineering plan, API contract, and UAT checklist may be added under `release6.2/` when implementation begins.
